## SAFE HANDLING

### Spreader beams

TOSH-SPREAD

The correct way to lift accommodation or office units to avoid damage or incident often involves the use of spreader beams in the rig. Their function is to position the lifting tackle by way of bracing lateral movement. This is adjusted by lengthening or shortening the beams to suit.

In addition, some of our really massive plates need to have more than one point to lift from due to their sheers size and weight.

We operate a range of spreader beams that can be configured in various different lengths to handle a variety of tasks and loadings.

Either as a 'for hire', or as part of our delivery and installation options.
